

NAME

airmass -- compute the airmass at a given elevation above horizon

USAGE

airmass elevation

PARAMETERS**elevation**

Elevation above horizon in either degrees or radians.

scale = 750.0

Scale factor of the Earth's atmosphere.

radians= no

Input elevation in radians instead of degrees.

airmass

On output, contains the computed airmass.

EXAMPLE

Compute the airmass at an elevation of 30 degrees above the horizon

```
cl> airmass 30
airmass 1.996 at an elevation of 30. degrees (0.5236 radians)
above horizon
```
